The sports betting future is bright in the Tar Heel State now that North Carolina's online sports betting is less than a year away from launching. The Tar Heel State already has in-person sports betting locations, so fans may already be familiar with common sports betting terms.

If you haven't tried sports betting before and want to be familiar with sports betting terminology, check out this helpful guide from our friends at SportsLine to see some of the most popular ways to wager.

Here are just a few.

**Futures:** You aren't limited to wagering on games happening right now.

Football season hasn't started just yet, but you can place a futures bet now on which team you think will win their division next winter.

SportsLine provides betting advice across the four major professional sports, college sports, golf, tennis, soccer, combat sports, horse racing, auto racing and more.

It's a proven resource to sports bettors around the world.

The most international of games offers the most heart-pounding drama.

Learn alongside our resident newbie, Priestly, as he discovers baccarat - one of

the easier games to play on the casino floor.

All numbered cards two through nine count as face value.

Other cards (jack, queen, king and ten) count as 0 and aces count as 1.

Any two cards which total 10 (ex: six & four) count as 0.

Wagers can be made anytime before "no more bets" is announced by the dealer.

If the point count of either hand is 8 or 9, it is called a "natural";

and no additional cards are drawn.

The drawing of a third card, if necessary, is dictated by strict rules depicted in the accompanying tables.

To create a model that can detect low-quality reviews, I obtained an Amazon review dataset on electronic products from UC San Diego. The dataset contains 1,689,188 reviews from 192,403 reviewers across 63,001 products. Most of the reviews are positive, with 60% of the ratings being 5-stars.

For the number of reviews per reviewer, 50% have at most 6 reviews, and the person with the most wrote 431 reviews.

Next, I used K-Means clustering to find clusters of review components. A cluster is a grouping of reviews in the latent feature vector-space, where reviews with

similarly weighted features will be near each other. This means a single cluster should actually represent a topic, and the specific topic can be figured out by

looking at the words that are most heavily weighted. For example, clusters with

the following words were found, leading to the suggested topics:

Reviewers

There is also an apparent word or length limit for new Amazon reviewers. To get

past this, some will add extra random text. This reviewer wrote a five paragraph review using only dummy text. This type of thing is only seen in people's earlier

reviews while the length requirement is in effect. After that, they give
